doctoral thesis dissertation from the year 2011 in the subject physics biophysics grade 1 0 tu dortmund language english abstract conformational properties of the full length human and rat islet amyloid polypeptide amyloidogenic hiapp and non amyloidogenic riapp respectively were studied at physiological temperatures by md simulations both for the cysteine and cystine moieties by means of a temperature scan it was found that 310k and 330k delimit the temperature at which the water percolation transition occurs where the biological activity is highest and were therefore chosen for observing the conformational properties of iapp at all temperatures studied iapp does not adopt a well defined conformation and is essentially random coil in solution although transient helices appear forming along the peptide between residues 8 and 22 particularly in the reduced form above the water percolation transition the reduced hiapp moiety presents a considerably diminished helical content remaining unstructured while the natural cystine moiety reaches a rather compact state presenting a radius of gyration that is almost 10 smaller than what was measured for the other variants and characterized by intrapeptide h bonds that form many bridges in the c terminal region this compact conformation presents a short end to end distance and seems to form through the formation of sheet conformations in the c terminal region with a minimization of the tyr phe distances in a two step mechanism the non aggregating riapp also presents transient helical conformations with a particularly stable helix located in proximity of the c terminal region starting from residues l27 and p28 these md simulations show that p28 in riapp influences the secondary structure of iapp by stabilizing the peptide in helical conformations when this helix is not present the peptide presents bends or h bonded turns at p28 that seem to inhibit the formation of the bridges seen in hiapp conversely hiapp is highly disordered in the c terminal region presenting transient isolated strand conformations particularly at higher temperatures and when the natural disulfide bond is present such conformational differences found in these simulations could be responsible for the different aggregational propensities of the two different homologues the increased helicity in riapp induced by the serine to proline variation at residue 28 seems to be a plausible inhibitor of its aggregation the specific position of p28 could be more relevant for inhibiting the aggregation than the intrinsic properties of proline alone

neuronal communication forms the basis for all behavior from the smallest movement to our grandest thought processes among the many mechanisms that support these functions spike timing is among the most powerful and until recently perhaps the least studied in the last two decades however the study of spike timing has exploded the heightened interest is due to several factors these include the development of physiological tools for measuring the activity of neural ensembles and analytical tools for assessing and characterizing spike timing these advances are coupled with a growing appreciation of spike timing's theoretical importance for the design principles of the brain spike timing mechanisms and function examines the function of spike timing in sensory motor and integrative processes providing readers with a broad perspective on how spike timing is produced and used by the nervous system it brings together the work and ideas of leaders in the field to address current thinking as well as future possibilities the first section of the book describes the foundation for quantitative analysis and theory it examines the information contained in spike timing how it can be quantified and how neural systems can extract it the second section explores how input output relationships are reflected in spike timing across a range of sensory systems drawing together multiple perspectives including theoretical and computational studies as well as experimental studies in a range of model systems the book provides a firm background for investigators to consider spike timing as it applies to their own work it also offers a glimpse of future advances related to mechanisms of spike timing and its role in neural function such as the development of novel computational technologies

this textbook is an introduction to systems and theoretical computational neuroscience with a particular emphasis on cognition it consists of three parts part i covers fundamental concepts and mathematical models in computational neuroscience along with cutting edge topics part ii explores the building blocks of cognition including working

memory how the brain maintains and manipulates information online without external input decision making how choices are made among multiple options under conditions of uncertainty and risk and behavioral flexibility how we direct attention and control actions part iii is dedicated to frontier research covering models of large scale multi regional brain systems computational psychiatry and the interface with artificial intelligence the author highlights the perspective of neural circuits as dynamical systems and emphasizes a cross level mechanistic understanding of the brain and mind from genes and cell types to collective neural populations and behavior overall this textbook provides an opportunity for readers to become well versed in this highly interdisciplinary field of the twenty first century key features rooted in the most recent advances in experimental studies of basic cognitive functions introduces neurobiological and mathematical concepts so that the book is self contained heavily illustrated with high quality figures that help to illuminate neurobiological concepts present experimental findings and explain mathematical models concludes with a list of core cognitive behavior tasks ten take home messages and three open questions for future research computer model codes are available via github for hands on practice
